

Lines for automating manufacturing processes

v1

2015/09/23

Sets of equipment used for automation of technological processes in series production. Can be equipped with loading, unloading systems, for stacking, interop transport, assembly, etc. Control of the whole line is integrated, control system controls all machining, assembly operations and the flow/movement of items between devices. The line has a common security system, with the fault finding the procedure for errors and failure.

Machines and control system are designed and adapted to the specific requirements of technological processes and planned performance.

TECHNICAL-OPERATIONAL DATA:

To be confirmed during technical review and approval procedure before the start of the implementation, according to needs of the customer.
